Hospital Discharge Summary Report

1992 - 2000

January 2002

Doc. No. 350520-020106

ACKNOWLEDGEMENTS

This report was prepared primarily by Ted Jarrell, Manager, Statistics and Research with the Bureau of Health Planning & Resources Management. Ed Ratledge, Director of the Center for Applied Demography and Survey Research at the University of Delaware, furnished invaluable consulting services.

The Bureau enjoyed the complete cooperation of Joe Letnaunchyn and Suzanne Raab-Long, President and Associate Vice President respectively, of the Delaware Healthcare Association as well as the management and staff of each of the individual hospitals.

Dear Reader:

I am pleased to present this 1992-2000 Hospital Discharge Summary Report.

Except for one section, the following report includes 2000 data. The one exception is Section C which is comprised of normative data comparing Delaware hospitals to national norms for average length of stay, average charge per discharge and percent of patients who died. The most recent year for which national norms (supplied by Solucient, Inc., Evanston, Illinois) are available is 1999.

While the comparisons of data to national norms take severity of illness and risk of mortality into account, it is worth remembering that a number of other factors in addition to hospital efficiency and effectiveness can affect comparisons. These include the level of uncompensated care provided, the extent of any teaching programs, a hospital's payor mix and the availability of appropriate placement resources such as nursing home beds and home health care.

We anticipate having our next update available in the fall of 2002.

Sincerely,

Robert I. Welch, Director Bureau of Health Planning

ant I Welen

and Resources Management

Introduction

This 1992-2000 Hospital Discharge Summary Report is based on data reported by Delaware's short-term general acute-care hospitals. Profiles of these hospitals, compiled by the Delaware Healthcare Association, begin on page 38. Except in the specific section on deliveries and newborns, information on newborns is excluded from all tables in the report.

While not included in this report, data were also collected from the duPont Hospital for Children and three psychiatric hospitals - Meadowwood, Rockford Center and Delaware Psychiatric Center. Data from these facilities will be useful as more focused reports are produced in the future. This report, however, includes only Delaware's acute care general hospitals.

The report contains selected summary discharge information, information on deliveries and newborns, normative length of stay, charge, and mortality comparisons for selected APR-DRGs¹, major diagnostic categories, and patient origin data based on patient ZIP codes.

Selected Summary Discharge Information -

(Section A)

Tables A-1 through A-3 show selected discharge information by hospital for 1992-2000. These include number of discharges, average length of stay, and average daily census.

In 2000, there were 79,907 discharges from the short-term general acute care hospitals in Delaware. It represented the highest total during the period from 1992 to 2000. Beebe had the greatest percent increase in discharges over the period (41.5%).

There was a downward trend in average length of stay and average daily census from 1992-1998. However, both measures increased in 1999 and 2000. In spite of this increase, there was a 17.7% decrease in average length of stay from 1992 to 2000. Nanticoke had the steepest decrease (32.0%). The overall average daily census decreased 12.1% from 1992 to 2000 with St. Francis having the steepest drop (58.2%).

¹ APR-DRGs (All Patient Refined Diagnosis Related Groups) comprise a patient classification system developed by 3M Health Information Systems. Version 15.0 of the APR-DRGs was used in this report.

Selected Delivery and Birth Information -

(Section B)

Table B-1 shows total deliveries, cesarean sections, and cesarean section rates for 1993-2000. Cesarean section rates varied by hospital with Beebe having the highest rate (32.9%) and Nanticoke having the lowest rate (19.6%) in 2000. After decreasing steadily from 1993 to 1996, rates began increasing in 1997. Recent increases in the cesarean section rate have also been observed at the national level.

Tables B-2 and B-3 contain 1999 comparisons of average length of stay, average charge per discharge, and percent of patients who died for the APR-DRG categories *Vaginal Delivery* and *Cesarean Delivery* for each hospital to national norms. A description of the APR-DRGs and norm-based comparisons appears in the section below.

Figures B-1 and B-2 show the Relative Charge Index per newborn and average length of stay per newborn by birth weight in 2000. These figures graphically portray the high medical costs associated with low birth weight babies. The weighted average charge per newborn weighing less than 1000 grams (2 lbs., 3 oz) was 47 times higher than for newborns weighing more than 2500 grams (5 lbs., 8 oz). The potential economic (not to mention human) gains from targeting efforts at reducing the incidence of low birth weight are staggering.

Normative Length of Stay, Charge, and Mortality Comparisons for Selected APR-DRGs - (Section C)

Section C contains 1999 comparisons of average length of stay, average charge per discharge, and percent of patients who died for selected APR-DRGs for each hospital to national norms². National norms were used for comparison because Delaware has such a small number of hospitals that comparison of hospitals within the state is problematic. Statistical comparisons of each measure to the expected value based on national norms were conducted using the 3M APR-DRG Analytical Workstation. The Workstation assigns each patient to an APR-DRG based on diagnostic and medical procedure information. It also assigns severity of illness and risk of mortality scores. Using this information in conjunction with national norms, it calculates an expected average length of stay and average charge per discharge that is adjusted for patient severity of illness.

_

² The 1999 APR-DRG norms were supplied by Solucient, Inc., Evanston, Illinois. They represent national norms for patients with similar severity of illness. The 1999 norms represent a geographically disperse sample of 2,544 hospitals with 16,075,783 discharges from 43 states and the District of Columbia.

Similarly, it calculates expected mortality rates that have been adjusted for risk of mortality. Finally, it makes comparisons between the actual and expected values using appropriate statistical tests. These tests are used to determine whether an observed difference between the actual and expected value is reliable³ (i.e., statistically significant). Based on these tests, a difference is classified as either reliably lower than expected, reliably higher than expected, or not reliably different than expected. It should be emphasized that comparisons among hospitals are not valid and should not be made.

Five APR-DRGs were selected for comparison for each hospital.⁴ The APR-DRGs that were chosen reflect the most frequently occurring in each specific facility (excluding newborns and deliveries) and therefore, vary from hospital to hospital. At Christiana Care, in addition to the five most frequent APR-DRGs, two dealing with coronary bypass surgery are included as well. The results of these comparisons are shown in Tables C-1 to C-6.

When considered as a group, Delaware Hospitals had an average charge per discharge that was lower than expected for each of the five most frequently occurring APR-DRGs. Average length of stay and mortality rates were either as expected or lower than expected for all five APR-DRGs except Simple Pnuemonia (APR-DRG 139) that showed a longer than expected average length of stay.

With respect to charges, it should be emphasized that there are very few patients for whom the full charge is actually paid. Also, hospitals provide substantial volumes of care to the medically indigent. It is particularly noteworthy that Delaware has no short-term general acute-care hospitals operated by the public sector.

Utilization Data by Major Diagnostic Category - (Section D)

The tables in Section D contain the number and percent of discharges by major diagnostic category for 1996 through 2000. The categories presented conform to the major sections found in the ICD-9-CM coding system. *Diseases of the circulatory system* and *Complications of pregnancy, childbirth and the puerperium* continued throughout the 1996-2000 period to be the categories with the greatest number of discharges, together accounting for over one-third of all discharges.

iii

³ The reliability or statistical significance of a difference is influenced by a number of factors including the number of discharges and the variability in the comparison measure (e.g., length of stay) among patients.

⁴ Two additional APR-DRGs relating to coronary bypass surgery were included for Chistiana Care Health System.

Patient Origin - (Section E)

Section E contains 1999 and 2000 discharges by ZIP code of patient residence for each hospital. This information should aid in the analysis of patient origin issues. Also included is a 2000 patient origin profile for each hospital.

 - ☆ Actual is higher than expected (statistically significant, p<.05)</p>

Notes:

- 1. Expected values reflect APR-DRG norms. APR-DRG norms were supplied by Solucient, Inc., Evanston, Illinois. They represent national norms for patients with similar severity of illness.
- 2. APR-DRGs comprise a patient classification system developed by 3M Health Information Systems.
- 3. Statistical comparisons exclude outliers. Outliers are defined as patients with an unusually long or short length of stay for their respective APR-DRG category. The criteria for such outliers were established based on extensive research by 3M Health Information Systems.

Christiana Care Health System

Introduction:

Name

Christiana Care Health System

General Background Accreditation

Christiana Care Health System serves Delaware and neighboring areas of Pennsylvania, Maryland and New Jersey. Christiana Care offers a continuum of services-including in-and out-patient hospital-based care, home health care, preventive medicine and rehabilitation, diagnostic and imaging services, transitional and long-term care, commercial and Medicaid managed care plans-in partnership with more than 1,200 community physicians, surgeons and dentists representing every medical practice and specialty.

Christiana Care has received the highest level of accreditation - accreditation with commendation in 1998, by the Joint Commission on the Accreditation of Healthcare Organizations (JCAHO).

Mission Statement: Christiana Care Health System is a community-based partnership of

physicians, hospitals, and other health care providers, dedicated to improving

the health of all individuals in the communities we serve.

Christiana Care is a not-for-profit, private health system operated by the Ownership:

Board of Directors of the Christiana Care Corporation. The Board represents

a cross-section of business and community leaders.

Medical Staff: Christiana Care's Medical-Dental Staff includes more than 1,200 community

physicians, surgeons and dentists representing every medical practice and

specialty.

Services Offered: Christiana Hospital, Christiana Care's flagship tertiary care facility, is the state's designated Level I (highest capability) trauma center. The Christiana

Hospital campus is also home to Christiana Care's:

Helen F. Graham Cancer Center – a state-of-the-art outpatient facility, opening in the spring of 2002. The center will serve as headquarters for our regionally acclaimed cancer program. The Cancer Program emphasizes improving prevention and early detection and improving survival and quality-of-life. Designated by the National Cancer Institute as a community clinical oncology program, Christiana Care provides access to today's most promising cancer research clinical trials.

- **Heart Center** the program's comprehensive services includes open heart surgery (more than 1,100 cardiovascular surgeries each year). diagnostic and interventional cardiac catheterization, dedicated electrophysiology lab, noninvasive studies, research, lipid program, rehabilitation and primary and secondary heart disease prevention.
- women's health program one of the busiest (6,800 births a year), most advanced maternity services in the nation, including a Level III (highest capability) neonatal intensive care unit.

The Eugene du Pont Preventive Medicine & Rehabilitation Institute features a full range of medically supervised preventive and alternative/complementary health services including nutrition and fitness, stress reduction and smoking cessation, adolescent pregnancy prevention, and special programs for

arthritis, asthma, cancer, cardiovascular disease, diabetes weight management

and osteoporosis.

Wilmington Hospital – includes an inpatient rehabilitation facility, joint replacement center, outpatient surgical facility, psychiatry services, speech and hearing services and an accredited sleep disorders center.

Number of Employees: 8,400 full and part-time, system-wide

Nanticoke Memorial Hospital

Introduction:

Name General Background Accreditation Nanticoke Memorial Hospital was originally incorporated in 1945 by a group of citizens concerned by the lack of health care facilities in western Sussex County. Over the years, involved citizens and a progressive administrative team have continued to direct the course of Nanticoke Memorial Hospital, and its affiliates, organized under the corporate title of Nanticoke Health Services. What started as a 32-bed hospital in 1952 has grown to include extended care, business services, outpatient services, psychiatric and chemical dependency services, medical centers across Sussex County Delaware and in Eastern Maryland, and a host of preventative medicine and health programs.

Accreditation

- > Joint Commission on Accreditation of Healthcare Organizations
- > American Association of Blood Banks
- ➤ Nuclear Regulatory Commission
